

## Septic System Inspection

A "septic system," also referred to as a private, on-site waste disposal system, receives waste water and solids from the home's plumbing facilities (bathrooms, kitchens, shower, laundry), treats, and then disposes of the effluent from this waste, by permitting it to absorb into soils at the property.

We test and inspect septic systems as well as cess pools. We open the septic tank, inspect the tank and baffles. We Photograph the baffles if possible. We introduce a volume of water into the system and probe the drain field for signs of high effluent, lush vegetation or saturated soil. We also test/inspect dosing tanks, alarms and pumps to insure they are working properly.
